NexStock

Phase 1 - Round 2 Retest

26 October 2026 | Production | Nexstock QA Company https://nexstock.stylotech.mu/app | Chromium / Windows

Outcome

Fix verification is incomplete: 2 of the 4 original tickets are fixed, 1 is partially fixed and 1 remains open. The seven previously failing cases now have 4 passes and 3 application failures.

Ticket	Result	Verified result
RET-001	FIXED	Existing customer selection and the full POS checkout now pass, including receipt printing and a fresh empty order.
RET-002	PARTIAL	PDF export no longer returns 404. Saved invoice identity and Rs 200 / Rs 230 totals pass. Saved header, banking instructions and payment notes are missing from exported PDFs.
RET-003	OPEN	Dialog content overlaps the action footer and blocks a normal Add to order click at 1920 x 1080 and 1440 x 900.
RET-004	FIXED	The active QA supplier is selectable; the deactivated vendor is excluded. Cleanup retained both new QA vendors inactive.

Required follow-up

Correct the variant dialog height, scrolling and footer stacking so the action receives pointer events. Ensure invoice export includes the saved invoice header and banking/payment instructions, with consistent configuration precedence. Redeploy and rerun the affected checks.

Separate Phase 1 Help check

HELP-001 is fixed in the executed checks: public Terms and Privacy open on desktop and mobile without submitting or validating login. Authenticated Help document access and visible version/commit checks remain blocked. Legal wording/approval and a deployment-matched release reference are not certified.

Execution and scope

Automation fixes were rerun: updated dialog label casing, precise receipt Print/Close controls, child-window print tracking and canonical invoice-number validation. Final remaining failures are application findings; no scoped test was intentionally skipped.

QA stock, VAT and temporary invoice header/footer settings were restored. Synthetic sales/invoices remain as evidence. No real payment charge, customer email or physical printing was performed. This targeted retest does not certify all Phase 1 or any Phase 2 requirements.

A changed production frontend bundle was verified after deployment confirmation. No authoritative deployed commit was supplied. Detailed evidence: blob-report/archive/phase1-round2-2026-10-26/verification-register.json.
