NexStock

QA Retest Summary

Test date: 24 October 2026 | Production | Desktop Chromium
https://nexstock.stylotech.mu/app | Nexstock QA Company

Outcome

Post-deployment retesting found substantial progress, but the release is not ready for full QA sign-off. Seven failing test cases relate to four confirmed application bugs; duplicate failures are grouped into single tickets.

Final result	Count
Feature checks passed	158
Failing test cases / unique confirmed bugs	7 / 4
Requirement / policy observations	2
Setup and cleanup checks passed	16
Local automation safety checks passed	67

What happened

Release-related checks ran across Products, Stores, Stock Adjustments, POS, Invoicing, Suppliers, Customers/AR, Security, Hardware and Settings.

Test scripts were updated for deployed controls, saved-state readiness and child-window printing. Automation issues were corrected and affected cases rerun; rate-limited probes were rerun sequentially.

Successful checks include product persistence, branch settings, stock details, checkout tenders, invoice/quotation saving, payment settlement, AR reconciliation and localization. A pass applies only to the assertions exercised, not an entire module.

QA stock and temporary settings were restored. Synthetic transaction records remain as test evidence; no real payment charge, customer email or physical printing was performed.

Next steps

Use the separate Markdown tickets for the four confirmed bugs and all seven affected tests. After fixes are deployed, rerun those cases. Clarify the two policy observations and complete remaining fixture-dependent, security and physical-device verification. PIN locking and branch registers remain explicitly deferred.

This revision only shortens the report; it does not represent a new test run. Detailed evidence remains in blob-report/archive/release-retest-2026-10-24/verification-register.json.
